HTML – Coding language for developing webpages

Things to always have:
- Tags Opening tag <> and closing tag </> (Similar to when you write an essay and start with a capital word, and end the sentence with a period.

Where do you write this code?
1. You can download a text editor called Atom: https://atom.io/
2. Press the download button, go to your downloads folder and click Atom or Search for Atom on your Search Bar
3. Exit all the Welcome to atom bars, there is one that is called untitled click that
4. Then click File on the top left of your screen → Click Save As → Then name the document whatever you want ex. Name.html so Anna.html, make sure whatever you name it is has the words **.html** at the end → change the location in *Where* to desktop
5. In your desktop you should see it appear, if so that's awesome! If not go back to step 4 and make sure you have .html at the end and your **location is saved to Desktop**!

Now.. the fun part!
1. In the document copy what is written below. From <!DOCTYPE html> to </html>

```
<!DOCTYPE html>
<html>
<body>
<h1>My First Heading</h1>
<p>Yay I made this</p>
</body>
</html>
```

2. Save this! Go to **File** on the top and click **Save**

3. Now go to your desktop and click the right button on your screen and click **Open**
4. You should see on your webpage My First Heading and Yay I made that.
5. Change some of the code. But make sure whatever you write there is a opening: <> and closing tag: </> between them!
